

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Thursday 03 04 2025

New snow

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **medium**

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Watch out for slabs of new snow!

Moderate avalanche danger (2nd degree) is declared in the high altitudes of the High and Western Tatras. During the last period of snowfall, the past two days, up to 15 to 20 cm of new snow fell very locally. Strong northerly winds are expected on the mountains above the forest belt, which will transport this snow to the leeward slopes of southern orientations. Along with further snowfall, up to 10 cm, unstable snow slabs and pillows will form. Mainly under saddles, rock walls, in moguls and steep couloirs. Avalanche release is possible especially with high additional loads.

Snowpack

Locally up to 20 cm of new snow will fall. At altitudes up to 1500 m above sea level there is only patchy snow cover.

Tendency

With snowfall rising.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Thursday 03 04 2025

Wind slab

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

Watch out for slabs of new snow!

In the high altitudes of the Low Tatras a low avalanche danger (1st degree) has been declared. During the last period of snowfall, the past two days, up to 10 cm of new snow fell very locally. Strong northerly winds are expected on the mountains above the forest zone, which will transport this snow to the leeward slopes of southern orientations. Here, unstable snow slabs and pillows will form, especially under saddles, rock walls, in moguls and steep couloirs.

Snowpack

At altitudes up to 1500 m above sea level, there is only patchy snow cover.

Tendency

No change.
