

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 26 12 2025

Persistent  
weak layer

1700m

Snowpack stability: fair

Frequency: few

Avalanche size: small

## With the cooling coming, a stable situation persists

In all mountain ranges where there is still a continuous snow cover (High, Low, Western Tatras) there is only a SMALL avalanche danger. The snow cover has stabilised due to the change in temperature. In the north and in the shade, loose, faceted snow and small snow slabs in places.

## Snowpack

The inverse situation of the last few days has changed. It has cooled down. This has created a hard, often load-bearing, firn on the surface of the snow cover. A continuous snow cover occurs in the Low Tatras from an altitude of about 1300 m and reaches 40 to 70 cm at the highest altitudes. In the Western and High Tatras there is snow from about 1600 m above sea level and its height is only up to 40 cm.

## Tendency
