

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 28 12 2025

Persistent
weak layer

1700m

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

With the cooling, a stable situation persists

In all mountain ranges where there is still a continuous snow cover (High, Low, Western Tatras) there is only a **SMALL** avalanche danger. The snow cover has stabilised due to the change in temperature. In the north and in the shade there is still loose, square-grained snow and small snow slabs in places.

Snowpack

The cooling has created a hard, often load-bearing, firn on the surface of the snow cover. The continuous snow cover in the Low Tatras occurs from an altitude of about 1300 m and reaches 40 to 70 cm at the highest altitudes. In the Western and High Tatras there is snow from about 1600 m above sea level and its height is only up to 40 cm. In the north and in shady localities there is sometimes loose, square-grained snow in the snow cover.
