

Danger Level 3 - Considerable

Tendency: Increasing avalanche danger
on Wednesday 01 04 2026

New snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Beware of snow slabs from new snow in steep terrain!

In the High and West is declared an CONSIDERABLE avalanche danger, 3rd level. The main avalanche problem will be new snow up to 30 cm, especially on the northern side of the Tatras. The snowfall will be accompanied by wind, which may worsen the situation. Avalanche release is possible on steep slopes with only a small additional load. Spontaneous avalanches from new snow in steep terrain and rock walls may also occur.

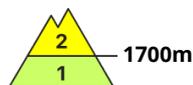

Snowpack

Snow cover was wet on most slopes throughout the profile due to temperatures above freezing except at the highest elevations and northern shaded orientations. This will change as it cools slightly. The new snow will be dry. More than 30 cm of new snow will be added in places. Continuous snow cover will be found at elevations above 1200-1500 m above sea level depending on orientation.

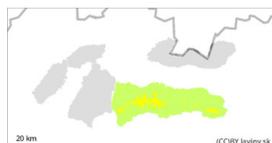

Tendency

Rising

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Wednesday 01 04 2026

New snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Watch out for new snow on windward slopes and in the gutters!

Moderate avalanche danger in the Low Tatras, level 2. Avalanche release is possible on steep slopes, especially with high additional load. Spontaneous avalanches from new snow are also possible.

Snowpack

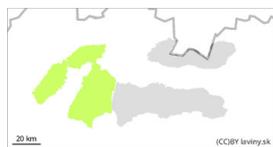

Up to 20 cm of new snow will be added. It will blow. The wind will create snow slabs, pillows and drifts. The snow is wet due to temperatures around 0°C, but will gradually become drier as it cools. Snow will be moist to wet up to 1600 m above sea level. Continuous snow cover can be found above 1200-1500 m above sea level, depending on orientation.

Tendency

With expected precipitation during the day >>INCREASING

pk

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 01 04 2026

New snow

Treeline

Snowpack stability: poor

Frequency: few

Avalanche size: small

Watch out for new snow!

Avalanche release is only possible at the highest altitudes of the Fatra Mountains on very steep slopes with higher additional loads. Occasionally, smaller spontaneous avalanches from new wet snow are possible.

Snowpack

About 10 cm of new snow will be added

Tendency

Persistent.
