

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 28 04 2026

Wet snow

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

Watch out for wet snow on sunny slopes on S exposures.

In the Tatras and Low Tatras there is only a SMALL avalanche danger = 1st degree. Snow cover is generally stable. The snow cover is firn-like in most locations and is well stable. Avalanche release is possible only sporadically on exposed southern slopes, especially as midday approaches and temperatures warm. Spontaneous avalanches are not expected.

Snowpack

A band of high pressure will influence the weather during Monday. Expect clear and warm weather. Snow cover is generally stable. The snow from the last snowfall period has been remade and has settled. Depending on the orientation, continuous snow cover can be found between 1300 and 1700 m above sea level. Its height reaches 30 to 150 cm, with the most snow in the Low Tatras.
