Danger Level 1 - Low

Tendency: Constant avalanche danger
on Wednesday 18 11 2026

New snow

2000m

Snowpack stability: poor
Frequency: few
Avalanche size: small

Wind slab

2000m

Snowpack stability: poor
Frequency: few
Avalanche size: small

In the highest elevations of the Tatra Mountains, small avalanches of loose and wind-drifted snow may occur under heavy additional loads.

The avalanche danger will be concentrated only in the highest elevations of the Tatra Mountains on leeward slopes facing south to east. This will primarily occur in very steep terrain with a significant additional load. A Level 2 warning has been issued for Tuesday, November 17, 2026, for strong winds that may reach speeds of up to 25 m/s. Light snowfall is expected during the day, with up to 10 cm of new snow. Under these conditions, there will be a LOW avalanche danger.

Snowpack

Due to warmer temperatures, the snowpack has stabilized somewhat; in many places, it has settled and hardened. In the northern sector, there is still dry, loose snow, which, combined with light snowfall and strong winds, will increase the avalanche risk.

Tendency

persistent
